Anthelmintic Activity Of Leaves Of Erythrina Indica Lam
M Jesupillai, M Palanivelu

Citation

Abstract
Ethanol, chloroform and ethyl acetate extracts of leaves of Erythrina indica (EI) were studied for its anthelmintic property against Pheritima Posthuma. The activity was assessed by the determination of time of paralysis and time of death of earth worms. Piperazine citrate (10mg/kg) was included as standard. All the three extracts exhibited good anthelmintic activity.

INTRODUCTION
Erythrina indica Lam is a middle sized tree belongs to the family Papilionaceae. The Bark, Leaves and Juice are being used in the traditional system of medicine for the treatment of various ailments such as liver trouble, convulsion, arthritis, etc. The present study was aimed to carryout anthelmintic activity of Ethanol, Chloroform and Ethyl acetate extracts leaves of Erythrina indica against Pheritima Posthuma.

MATERIALS AND METHODS
The leaves were collected from Madurai District, Tamilnadu, India and authenticated by Dr. Stephen, Dept. of Botany, The American College, Madurai, Tamilnadu, India. A voucher specimen (EI 1) have been kept in our laboratory for future reference.

PREPARATION OF THE EXTRACT
The coarsely powdered leave materials were extracted exhaustively with Ethanol (95%), Chloroform and Ethyl acetate by using Soxhlet apparatus. These extracts were concentrated under reduced pressure and preserved in desiccators until further use.

ANTHELMINTIC ACTIVITY
The method described by Dash et al. was employed for evaluating anthelmintic activity. Pheritima posthuma (obtained from horticulture department, Madurai, Tamilnadu, India) of approximately equal size (15 Cm) was divided in to seven groups. Each group consists of six earth worms of same type and treated with any of the following.

STATISTICAL ANALYSIS
All the values were represented as Mean ± S.E.M using student ‘t’ test. P< 0.001 (Compared to standard) was considered significant.

RESULT AND DISCUSSION
Ethanol, chloroform and ethyl acetate extracts of leaves of
EI showed significant anthelmintic activity (table.1) at the concentration 50 mg/ml and 100mg/ml against Pheritima posthuma. Activity was found to be increased with dose (shortest time of paralysis and death was observed at 100 mg/ml) and the activity was comparable to the well known anthelmintic agent Piperazine citrate.

Indian earth worms resembles intestinal round worm parasite of human beings. Anthelmintic activity of Piperazine citrate mediated through hyper polarization that leads to muscle relaxation and flaccid paralysis. Tannins produced anthelmintic activity by binding to free protein in the gastrointestinal tract of the host animal or glycoprotein on the cuticle of the parasite. Phenolic compounds (tannins are poly phenolic compounds) by uncoupling oxidative phosphorylation hinder the energy production in helminth parasites. Phytochemical analysis of leaves of Erythrina indica revealed the presence of tannins as one of the constituent. Anthelmintic property of Erythrina indica may due to either or both of above mechanism. The present study conclude the fork claim use of Erythrina indica as anthelmintic and required further study to determine the mechanism involved and constituent responsible for anthelmintic property.
