Dilated Pore of Winer, Dr. Louis H Winer and Wine Glass

Citation

Abstract
I have made a personal observation that a dilated pore of Winer, on microscopic examination resembles a glass of red wine.

Over the years I have been telling the residents that the recognition of a dilated pore under the microscope (Figs. 1, 2, 3, and 4) is an easy one because it looks like a ‘wine glass’. Moreover, if the pore is filled with keratin, it may resemble a glass of red wine (Fig.5). Interestingly, the lesion was first described by a dermatologist named Dr. Louis H Winer [1]. I am showing several photomicrographs of dilated pore to illustrate my observation.

COMMENT
Dilated pore is a fairly common lesion of adult male occurring mostly on the face and neck and usually presents as a giant comedone. Microscopically (Figs 1, 2, 3, 4) the lesion is a funnel-shaped dilated hair pore, sometimes containing keratin plug. The pore is lined by keratinizing squamous epithelium which may show acanthosis and basaloid proliferation extending as irregular strands into the dermis from the deeper part of the pore.

ACKNOWLEDGMENTS
Dr. Amy Kerkvliet helped with the figures.
